

September. Total meningitis cases since the first of this year were 14,523, compared to a five-year median figure for the year to date of 1,602.

Infantile paralysis cases dropped to 679 for the week ending Oct. 2, from

818 the preceding week. Decreases were particularly notable in those states previously reporting the largest number of cases: California, Texas, Kansas and Illinois.

Vaccines Against Virus

Protection against certain virus diseases, such as virus pneumonia, may be provided by serums and vaccines from the blood of hens and roosters.

➤ **VACCINES** to protect against certain virus diseases, such as virus pneumonia, parrot fever and lymphogranuloma venereum, or antisera to cure the diseases may some day be developed from chicken blood, it appears from a report by Maurice R. Hilleman and Dr. F. B. Gordon, of the University of Chicago. (*Science*, Oct. 15)

A chicken antiserum that definitely protects mice against a virus pneumonia peculiar to these animals has been developed by the Chicago scientists. A single dose of the antiserum given either before or after a dose of pneumonia virus has a protective effect, but an even greater effect is obtained when several doses of the antiserum are given during the first three days after the pneumonia virus infection.

This mouse pneumonia is caused by a virus which is very definitely related to the viruses that cause the human diseases, parrot fever, lymphogranuloma venereum, meningopneumonitis, trachoma, inclusion conjunctivitis and some of the atypical pneumonias now being re-

ported in increasing numbers of cases.

So far it has been impossible to produce vaccines or antisera for these diseases by the usual methods, such as inoculating horses or rabbits to produce virus-fighting antibodies in their blood. In fact, not even enough virus-fighting antibodies can be produced in the blood of such animals to provide good material for diagnostic tests or tests to help distinguish various unfamiliar virus diseases from each other.

Inoculating the virus into roosters seems to do the job, at least to the extent of producing a plentiful supply of mouse pneumonia virus antibodies in the rooster's blood. Serums with enough human disease virus antibodies for test purposes at least can probably be produced from chicken blood by the same methods.

"It is also possible," the Chicago scientists state, "that such serums would prove of value in treatment of human infections with these agents. Further investigation along these lines is under way."

ative of diaminodiphenylsulfone. Both Promin and the chemical from which it was derived were developed after attempts to cure tuberculosis with sulfanilamide failed. The hope was that some chemical modification of sulfanilamide might give it tuberculosis-conquering powers.

Diaminodiphenylsulfone itself is toxic to mice, but can be detoxified, Dr. Raiziss discovered, by combining it with sodium formaldehyde sulfoxylate.

The detoxification which apparently makes it safe does not reduce its power as a germ-fighting remedy. In mice Diasone is as effective as sulfanilamide in curing streptococcus infections, Dr. Raiziss reports, and almost as effective as sulfadiazine in curing Type II pneumonia.

Its most important property as a germ-fighter, however, is its action against experimental tuberculosis in guinea pigs.

"With its background of low toxicity and effectiveness in experimental infection," Dr. Raiziss states, "this drug gives promise of favorable clinical application in tuberculosis."

MEDICINE

New Plaster Cast Treatment Of Burns Has Good Results

➤ **GOOD RESULTS** with a new plaster cast treatment for burns of arms, legs, feet and hands are reported by Dr. Stanley M. Levenson and Dr. Charles C. Lund, of Boston City Hospital and Harvard Medical School. (*Journal, American Medical Association*, Oct. 2)

Possibility that the method may in the future be used for treating burns in the armed forces appears from the fact that the work reported was done under a contract, recommended by the Committee on Medical Research, between the Office of Scientific Research and Development and Harvard University. Further suggestion of this appears in the emphasis the doctors put on the wide availability of the materials needed for the treatment, their lack of bulk and the fact that the cast will protect the burned extremity from injury if the patient has to be moved.

Healing is as rapid as with other methods of treating burns, the doctors state and ability to move the burned arm, leg or hand returns more rapidly.

The lack of pain felt by the patients, from the start of treatment to complete healing is described as "remarkable." As soon as the cast is on, the pain disappears. A slight dull ache was felt for

MEDICINE

Hope for TB Conquest

Expectation that new drug, Diasone, may wipe out dread disease is strengthened by the favorable results in tests on guinea pigs.

➤ **HOPE** that a chemical may yet be developed which can conquer tuberculosis as the sulfa drugs have conquered pneumonia and other infections appears in a report by Dr. George W. Raiziss, of the Abbott Laboratories. (*Science*, Oct. 15)

Diasone is the short name of the drug which is the latest white hope for a medicine that will cure tuberculosis. Tests on

guinea pigs of this and various other compounds, including Promin which has also given promise of curing tuberculosis, show that Diasone "produced the most beneficial" results in treating tuberculosis in the guinea pigs, Dr. Raiziss reports.

The full chemical name for Diasone is disodium formaldehyde sulfoxylate diaminodiphenylsulfone. Promin is a deriv-
