U. S. Plans Mile-Wide Atom-Smashing Machine

► THE UNITED STATES is planning to build a 200-billion-electron-volt atom smasher, requiring a giant steel ring of magnets a mile in diameter, Dr. Lloyd Smith, theoretical physicist of the University of California Lawrence Radiation Laboratory, Berkeley, Calif., reported.

Dr. Smith provided the first glimpse at the concept of a super-atom smasher now under study at Berkeley. Building the giant was recommended by a national panel of U. S. scientists last spring.

The scientist said the main accelerator would have some 600 to 700 magnets, forming a ring three feet square in cross section. About 20,000 tons of steel would go into the magnets. To absorb radiation produced, 30 feet of earth would cover the ring.

In the heart of the ring would be a three-by-six vacuum tube, a nuclear freeway over which protons, the nuclei of hydrogen atoms, would race to 200 billion electron volts (Bev).

The enormous energy of protons emerging from the machine would require that they have a flight path a mile long. Along this path magnet switching yards would be placed to sort and guide particles to detectors.

Before protons entered the huge accelerator, they would have to be started up in a smaller machine. Dr. Smith said one way would be to build a "baby" version of the big machine, with an energy of about five Bev. Another idea is to build the most powerful proton linear accelerator ever constructed, and put it inside the giant ring.

Some 150 megawatts of power would be needed for the accelerator and its experimental equipment.

"We hope the machine will help clarify present puzzles about the ultimate structure of matter," Dr. Smith said. "It should help establish simple laws to describe nuclear forces and provide knowledge necessary for better use of those forces."

Dr. Smith presented the preliminary picture of the machine in a paper prepared for delivery at the meeting of the 1963 International Conference on High Energy Accelerators at the Joint Institute for Nuclear Research in Dubna, about 60 miles from Moscow.

STEREOZOOM® HELPS PRECISION-MANUFACTURE THE MICROMINIATURE AT HUGHES AIRCRAFT...

The Semiconductor Division of HUGHES AIRCRAFT Company, Newport Beach, California, fabricates MICROSEAL* transistors and diodes. The MICROSEAL configuration is a small, ceramic cylinder, .062 inches in diameter. Total thickness is .030 inches. Metal and ceramic are brazed together to form a hermetically tight container.

The Bausch & Lomb StereoZoom microscopes permit seeing these microminiature parts in enlarged, natural, three-dimensional detail. The long (up to 7"), unobstructed working distance of the StereoZoom allows intricate assembly operations without damage to delicate parts. A turning of the zoom dial gives continuously variable magnification without altering working distance.

A wide choice of 24 models assures you of obtaining just the right one for *your* inspection and assembly needs. For an on-the-job demonstration of the B&L StereoZoom microscope, call our nearest office, your dealer, or write Bausch & Lomb Incorporated, 16044 Bausch Street, Rochester 2, N. Y.
