

Now, for the physics teacher who wants to teach optics—thoroughly. The AO Gas Laser and Demonstration Kit.

This new teaching system provides unprecedented capability for classroom demonstration of geometrical and physical optics.

The AO Gas Laser produces a 2-milliwatt narrow beam of visible red light—ample power for effective demonstrations. The laser output is controlled by a single on-off locking switch with removable key.

The AO Demonstration Kit contains a wide variety of optical components for use with the gas laser, and an instruction manual designed to accompany a modern optics course. Numerous demonstrations and experiments are outlined including light refraction, light reflection, polarization, interference and diffraction.

Ask your AO dealer for a demonstration or write for more information.
