## new products

**Filmstrips on earth science** help to remedy the situation in which many teaching materials on geology have been made obsolete by the new plate-tectonics theory of the origin of ocean crust and continents. The set of four full-color sound filmstrips, "Earth's Biography," is based on the Earth Science Curriculum Project. The filmstrips explain and interpret geological history in terms of shifting crustal plates and other concepts of the theory. The four filmstrips are: (1) "Reading Rocks," (2) "How Our Continent Developed," (3) "How Life Evolved" and (4) "Enter: Prehistoric Man." For junior high school and up. Available with records or cassettes.

**Celestial navigation work forms** are professionally designed to be used with reference tables and the Nautical Almanac. They simplify calculations and reduce the chance of making an error. These forms are intended for use by experienced, active navigators, as well as those learning to navigate. Each pad consists of 50 work forms and a transparent, waterproof, press-to-seal carrying case. The pads are 3-hole punched for easy insertion into the navigator's workbook. Step-by-step instructions along with four examples (sun, planet, moon, stars), are included with each pad.

**Environmental science catalog** is comprehensive offering of materials available in the environmental sciences. Areas covered by specific kits and equipment include solid-waste management, phosphates, noise pollution, mercury detection, soil tests. There are many more. Illustrated, 300-page catalog has expanded sections in biology, chemistry and standard lab supplies. Materials have been updated to reflect revised editions of curriculum-revision programs in physics, biology and chemistry.

**Morphine test** is a highly sensitive and economical drug screening process. This test will result in increased proficiency in drug testing in commercial labs, hospital labs, methadone treatment clinics and drug control programs. The test's most important characteristic is its sensitivity. It is capable of detecting morphine in urine at a level of 10 nanograms (.010ug) morphine per ml, which makes feasible the determination of the use of heroin by an addict as much as 72 to 96 hours following its injection. This sensitivity also tends to defeat attempts to foil detection by the intake of large volumes of liquid in an attempt to dilute the concentration.
