Odysseys to a Giant

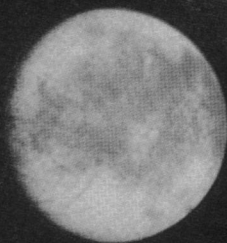

As the largest planet in the solar system and the most splendid object in the night sky, Jupiter has fascinated humankind since the beginning of time.

The amount of information revealed by the Pioneer and the more recent Voyager missions to this giant planet has been greater than the accumulated findings of centuries.

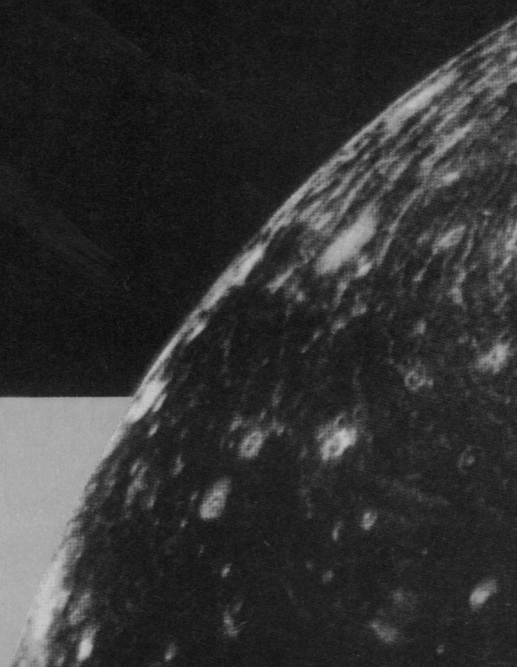

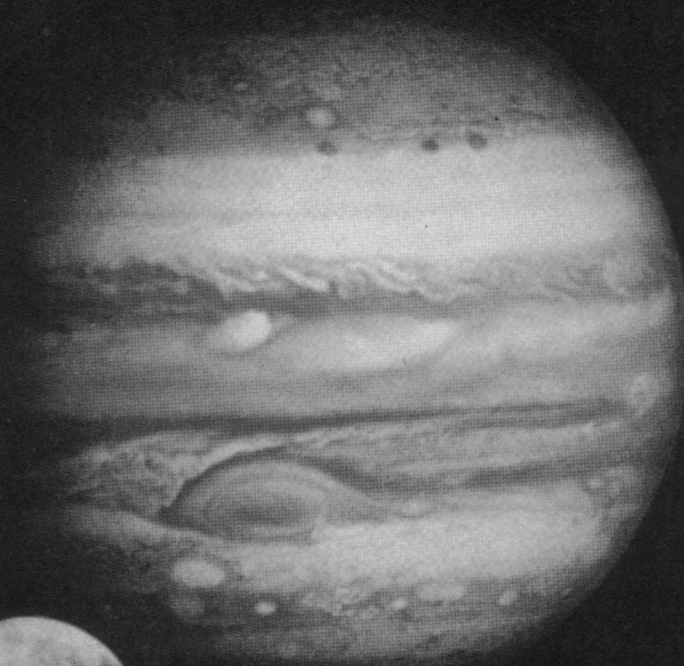

In *By Jupiter*, Eric Burgess surveys the history and the extent of our knowledge of this mighty planet. The story unfolds the gradual — and sometimes revolutionary — improvement of information, information-gathering equipment, and the thinking surrounding our understanding of Jupiter.

This wonderful volume has more than 130 black-and-white photographs. Its excellent text gathers together the vastly increased knowledge, and the remaining questions, about the giant planet.

By Eric Burgess
