# The Sex Life of Flowers

**S**ex is as important to plants as it is to animals. But whereas animals can move around, allowing partners to come together for courtship and mating, most plants must use the borrowed mobility of animals, the wind, even water to transport pollen.

This beautifully photographed and illustrated book tells a fascinating story of the astonishing variety of methods evolved by plants to achieve pollination.

— *The Sex Life of Flowers*

**B**astiaan Meeuse, the author of *The Story of Pollination*, and Sean Morris, a founder and director of Oxford Scientific Films, have created a "marvelous book in which the relationship of illustrations to text is exact . . . and the photos are all of superb quality. It should be on every naturalist's desk or table (not on the shelf!)."

— *Herbert G. Baker, professor of botany at University of California at Berkeley, for a review in Natural History (9/84)*
