

McGraw-Hill Concise Encyclopedia of SCIENCE & TECHNOLOGY

Sybil P. Parker
Editor in
Chief

"This [volume] covers the entire spectrum of science and technology. ... truly ... an authoritative and comprehensive survey of the pure and applied sciences."
— Booklist

"This new fifth edition ... is of top quality and will be valuable to readers with both special and general interests. ... Highly recommended."
— Science Books & Films

"The encyclopedia does offer one danger. It is so readable, so well illustrated and, well, just plain interesting that the urge to browse aimlessly through its pages is delightfully overwhelming."
— Graduating Engineer

- 2,065 Pages
- 7,300 Separate Entries covering 75 Disciplines
- 3,000 Entry Index
- 1,600 Illustrations
- Bibliography and Data Bases

McGraw Hill Book Co.,
1984, 2,065 pages, 9"x11",
hardcover, \$95.00

By Irvin Rock

In *Perception*, one of the leading researchers in the field, aided by more than 200 photos and drawings, investigates the problems posed by both correct and illusory perception. How do we perceive depth, shape and motion? What bearing do geometrical illusions have, if any, on correct perception? How do we explain our accurate perception of black or white surfaces when illumination is so variable? The author also addresses broader issues such as the role of experience in our perceptions, the effect of touch on visual perception, and the implications of picture perception for our understanding of art.

Reversible vase created for Queen Elizabeth's Silver Jubilee in 1977. We see either a vase or two profiles depending on how we organize the visual pattern.

CONTENTS

The World of Perception
 Constancy
 The Many Paths to the Third Dimension
 Perception and Art
 Form and Organization
 Geometrical Illusions
 The Perception of Motion
 The Upright World
 The Intelligence of Perception

Irvin Rock explores the processes of everyday perception by challenging those processes with ingenious experiments contrived by himself and other investigators in the field. He elucidates the province of perception in a fresh and appealing way, helping us to understand the wondrous riddle of perception: how the brain manages to transform the distortion-prone, two-dimensional images established on the retina into the rich, constant, three-dimensional representation of the world around us. A stereo viewer bound into the inside back cover of the book allows readers the visual pleasure of the stereograms Rock discusses.

Irvin Rock is widely known for his research on the moon illusion, the effect of orientation on form perception, the relation between vision and touch and, most recently, the intelligence of perception. Currently a professor in the Program in Cognition at Rutgers University, he is the author of *The Nature of Perceptual Adaptation*, *Orientation and Form*, *An Introduction to Perception* and *The Logic of Perception*.
