## Stories of a Neurologist and His Patients

By Bruce H. Dobkin

Neurologist Bruce Dobkin is summoned by the insistent bleeping of his pager. His answering service reports several emergencies: An apparently healthy, vigorous young rock climber has overnight grown so weak that he can't stand up. A fellow doctor is displaying all the classic symptoms of stroke but isn't responding to any of the standard therapies. And the wife of a friend has had a scuba-diving accident that has left her with practically no working brain, but so seemingly alive that her husband and children refuse to accept that she'll remain in that vegetative state as long as she continues to breathe.

**Brain Matters** is a scientific whodunit in which a highly trained medical detective tracks down the culprits behind behavior that ranges from an alcoholic's twitching toes to a woman barber's uncontrolled cursing. In diagnosing and treating the bizarre spectrum of these symptoms, and in dealing with the ethical and human issues surrounding any medical intervention into the brain, Bruce Dobkin takes the reader on a guided tour of the anatomy, physiology and psychology of the organ that makes us human.

"Bruce Dobkin makes neurology as absorbing as a detective story. **Brain Matters** is a compassionate, moving, totally fascinating account of human brains hanging in the balance. More than any other scientific book on the subject, Dr. Dobkin's narrative portraits of his patients portray the importance of the brain and how our entire existence depends on its exquisite, intricate, and often fragile functioning."
