Cooling Continents With a Living Blanket

A Natural History of Domesticated Mammals

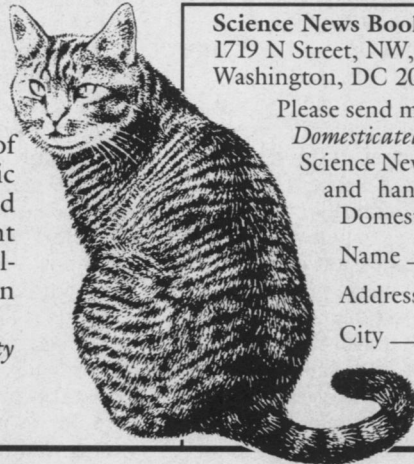

By Juliet Clutton-Brock

This book presents the archaeological and historical evidence for early mammal domestication. The author explores how humans have manipulated the lives of other mammals since the Ice Age: how the cat came to be a common pet, why the domesticated horse remains closely related to its wild ancestors, when camels were domesticated and whether there are any wild ones left. Beautifully illustrated, this book is for the scientist or general reader. Originally published in hardcover by the British Museum in 1987.

"... an expert introduction to the study of the nature and early history of domestic mammals, one that can be profitably read by everyone from the beginning student to the professional archaeologist or zoologist. . . . Such an introduction has been needed for years. . . ."

Observing the Constellations

An A-Z Guide for the Amateur Astronomer

By John Sanford

Exploring 88 constellations in alphabetical sequence, *Observing the Constellations* is a fascinating introduction for casual stargazers and a valuable reference tool for experienced amateur astronomers. Each constellation is beautifully documented with both a full-color photograph and a detailed star map. Sanford's photographs show the constellations as they actually appear in the night sky — an innovative and valuable aid for finding and identifying specific objects. The detailed star maps, prepared by Wil Tirion, a leading astrocartographer, not only show the brighter stars that are easily visible with the naked eye, but also give the positions of fainter objects — stars, nebulae and clusters — that more serious astronomers will want to observe. The book also provides background information on each constellation, including a clear explanation of how to find it in the sky, a description of the stars and of unusual or exotic objects that appear within the constellation, and a discussion of the mythology association with it.
