The Weekly Newsmagazine of Science

A Science Service Publication
Volume 137, No. 7, February 17, 1990

E. G. Sherburne Jr.	Publisher
Patrick Young	Editor
Laurie Jackson	Managing Editor
Janice Rickerich	Production/Design Director
Bruce Bower	Behavioral Sciences
Ivan Amato	Chemistry/ Materials Science
Richard Monastersky	Earth Sciences
Janet Raloff	Environment/Policy
Ron Cowen	General Science
Kathy A. Fackelmann,	Life Sciences/ Biomedicine
Rick Weiss	
Ivars Peterson	Mathematics/Physics
Jonathan Eberhart	Space Sciences
Jennifer L. Miller	Editorial Assistant
Caroline C. Decker	Science Writer Intern
Wendy Smith	Books/Resource Manager
Donald R. Harless	Advertising/Business Manager

Copyright © 1990 by Science Service, Inc.
Editorial and Business Offices:
1719 N St., NW, Washington, D.C. 20036.
Republication of any portion of SCIENCE NEWS
without written permission of the publisher is
prohibited.

Subscription Department:
231 West Center St., Marion, OH 43305

Subscription rate: 1 yr., \$34.50; 2 yrs., \$58.00.
(Foreign postage \$6.00 additional per year.) Change of
address: Four to six weeks' notice is required. Please
state exactly how magazine is to be addressed.
Include zip code. For new subscriptions only call
(1) 800-247-2160. Printed in U.S.A. POSTMASTER:
Send address changes to SCIENCE NEWS, 231 West
Center St., Marion, OH 43305. Second class postage
paid at Washington, D.C., and additional mailing
offices. Title registered as trademark U.S. and
Canadian Patent Offices. Published every Saturday
by Science Service, Inc., 1719 N St., NW,
Washington, D.C. 20036. (202-785-2255)
ISSN 0036-8423

Charge confusion clarified

In "Renewing bonds to recharge batteries" (SN: 11/25/89, p.342), Ivan Amato misidentifies the positive pole as the anode and the negative pole as the cathode of a battery.

In a galvanic cell (more properly the device should be called a galvanic or voltaic cell rather than a battery), the negative pole is the anode and the positive the cathode. In an electrolytic cell, the negative pole is the cathode and the positive pole is the anode. The easiest way to remember which is which is to remember that the electrons always enter the system at the cathode.

Hance H. Hamilton
Dallas, Tex.

In electrolytic cells, which are driven by an outside source of electricity, the anode and cathode are indeed the positively and negatively charged electrodes, respectively. The cathode reaction is driven by electrons arriving from the outside source. As you point out, this is not so with batteries, or galvanic cells, in which electrons from a discharging battery's anode

Articles

104 Rattling the Northwest

Cover: Geologists are finding signs that huge, earthquake-generated waves have pummeled the coastline of the Pacific Northwest several times during the last 1,000 years. These and other geologic hints of prehistoric jolts have generated concern that a massive quake might lurk in the region's future. (Photo: Washington State Tourism Division)

travel to the cathode. The battery's anode is negatively charged, its cathode positively charged.

When the rechargeable battery described in the article is discharging, the lithium electrode is the negatively charged electrode and the polymer-based electrode is the positively charged electrode. During recharging, the electrodes' charge-assignments reverse, and so do the respective assignments of "anode" and "cathode." To avoid confusion when talking about galvanic cells, battery developer Lutgard C. De Jonghe suggests substituting the terms "cathode" and "anode" with "negative electrode" and "positive electrode," respectively.

— I. Amato

Mycoplasma reclassified

"An Aids-Associated Microbe Unmasked" (SN: 12/2/89, p.356) presents an oddly outdated view of the classification of mycoplasmas. These organisms have been considered bacteria since at least 1974, and not, as stated in the article, intermediate forms between bacteria and viruses. The demise of

that view began with the invention of the electron microscope many years earlier.

The most powerful tool for investigating genetically oriented relationships among organisms is based upon their 16S RNA makeup. I am informed by persons in that field that this method places mycoplasmas squarely among the typical eubacteria (true bacteria) and that, far from being intermediate between bacteria and viruses, they are not even members of the more primitive archaebacteria. They are simply bacteria that have lost the ability to produce peptidoglycan, which affects their appearance.

I hope the researchers involved in the new studies have not missed these developments.

Kenneth L. Temple
Emeritus Professor of Microbiology
Montana State University
Bozeman, Mont.

Study director Shyh-Ching Lo agrees that gene-structure studies indicate mycoplasmas are true bacteria. He says confusion has persisted because mycoplasmas, like viruses, have small genomes and lack cell walls.

— R. Weiss
