The Weekly Newsmagazine of Science

A Science Service Publication
Volume 137, No. 10, March 10, 1990

E. G. Sherburne Jr.	Publisher
Patrick Young	Editor
Laurie Jackson	Managing Editor
Janice Rickerich	Production/Design Director
Bruce Bower	Behavioral Sciences
Ivan Amato	Chemistry/ Materials Science
Richard Monastersky	Earth Sciences
Janet Raloff	Environment/Policy
Ron Cowen	General Science
Kathy A. Fackelmann, Rick Weiss	Life Sciences/ Biomedicine
Ivars Peterson	Mathematics/Physics
Jonathan Eberhart	Space Sciences
Jennifer L. Miller	Editorial Assistant
Caroline C. Decker	Science Writer Intern
Wendy Smith	Books/Resource Manager
Donald R. Harless	Advertising/Business Manager

SCIENCE NEWS (ISSN 0036-8423) is published weekly on Saturday, except the last week in December, for \$34.50 for 1 year or \$58.00 for 2 years (foreign postage \$6.00 additional per year) by Science Service, Inc., 1719 N Street, N.W., Washington, D.C. 20036. Second-class postage paid at Washington, D.C., and additional mailing office. **POSTMASTER:** Send address changes to SCIENCE NEWS, 231 West Center Street, Marion, OH 43305. Change of address: Four to six weeks' notice is required — old and new addresses, including zip codes, must be provided.

Fruitful connection

Having participated in the Geometry Supercomputer Project, I was glad to see "The Color of Geometry" (SN: 12/23&30/89, p.408). I wish to comment on the caption for the cover, which claims, "Mathematicians . . . study geometric forms ranging from knots to figures embedded in hyperbolic space."

Although knots and hyperbolic space may seem to have little to do with each other at first glance, there are actually some very useful connections between them. One method of studying a knot involves studying its complement, the space outside of the knot. For many knots, hyperbolic structures can be placed on their complements, and these hyperbolic structures are useful in distinguishing between different knots. Computers, combined with some serious mathematical

Research Notes

- 156 Biomedicine
- 158 Biology
- 158 Earth Sciences

Articles

- 152 Smart as a Brick
Cover: The world of biology is filled with tissues and structures that behave as though they were smart. Take the small leaves, or leaflets, of *Mimosa pudica*, which produces beautiful flowers like the one shown on the cover. The slightest touch of a finger, or a hungry bug, causes the leaflets to close like so many sets of praying hands. With biological tissues for inspiration, researchers in an embryonic field known as intelligent material systems and structures are developing inanimate, yet life-like, structures that sense and respond to their surroundings. theory, are very useful in this approach, which is another thing studied in the Geometry Supercomputer Project.

Sometimes connections between seemingly unrelated areas of mathematics turn out to be very fruitful.

Martin V. Hildebrand
Graduate student, Dept. of Mathematics
Harvard University
Cambridge, Mass.

Molecular monickers

The name buckminsterfullerene for the 60-carbon molecule described in "Making chicken wire of molecular size" (SN: 12/23&30/89, p.406) is not entirely fair to Archimedes, because the corresponding solid object is the truncated icosahedron, one of the 13 "semiregular" solids discovered by that great mathematician.

The 80-carbon molecule on chemist Orville Chapman's wish list and illustrated in your article does not correspond to an Archimedean or semiregular solid, in which, by definition, all the vertices are congruent but not all the faces. Perhaps the 80-vertex solid should be called "demisemiregular" because the vertices fall into two classes instead of only one.

I.J. Good
Professor of Statistics
Virginia Polytechnic
Institute & State University
Blacksburg, Va.

CORRECTION

The caption for the Jan. 6 cover photo erroneously describes the cost of the Hubble Space Telescope as \$2 million. The correct figure is \$2 billion, as stated in the article.
