PLANETS BEYOND

Discovering the Outer Solar System
Revised and Updated

By Mark Littman

"Well-written and rich . . . Planets Beyond is one of the best popular astronomy books in recent years."

—Sky and Telescope

John Wiley & Sons, 1990, 7 1/4" x 9 1/4",
319 pages, paperback, \$16.95

It used to be that Uranus, Neptune and Pluto each received a vague paragraph in astronomy textbooks. Not much of interest. Not much was known. Now each is a world surrounded by worlds with unique and fascinating stories to tell us about their evolution and, because they have been less changed by the Sun, about the formation of the solar system itself. These geologic worlds have stories as worthy of recounting as their discoveries.

In these pages are striking personalities and high drama; profound confirmations of universal scientific laws; human arrogance and stupidity; intellectual courage and perseverance; triumph, humor, irony and tragedy. Here are scientific discoveries as they were made and modern scientific research as it bounds and staggers forward with uncertainty and brilliance.

Why are we here? How is it that human beings are among the more successful forms of life on Earth today? There are many answers to these questions, depending on the prejudices of the person you address them to. A cosmologist might tell you about the Big Bang in which our universe was born and the way in which the chemical elements of which our bodies are composed were cooked in stars. An evolutionary biologist might talk of natural selection

and survival of the fittest. Both have a point. But we blame the weather . . .

— John & Mary Gribbin

Basil Blackwell,
1990, 199 pages,
6" x 9 1/4", hard-
cover, \$24.95

In **Children of the Ice**, John and Mary Gribbin tell the story of the origins and evolution of humankind, set against a backdrop of dramatic climatic change. It was a catastrophic cooling of the globe that contributed to the demise of the dinosaurs and opened up new environments for mammals in particular; and it was climatic change that forced one kind of mammal, a tree-dwelling ape, out of the forests of Africa onto the savannah and the path to intelligence. The authors convincingly show that the origin of human intelligence is intimately connected with the series of ice ages that the world has experienced over the past five million years — we are the Children of the Ice.

But what of the future? Are the man-made climatic changes we are currently experiencing the clue for another dramatic — and possibly terminal — phase of human life?
