The Weekly Newsmagazine of Science

A Science Service Publication
Volume 139, No. 18, May 4, 1991

E. G. Sherburne Jr.	Publisher
Patrick Young	Editor
Laurie Jackson	Managing Editor
Janice Rickerich	Production/Design Director
Janet Raloff	Senior Editor Environment/Policy
Bruce Bower	Behavioral Sciences
Elizabeth Pennisi	Chemistry/ Materials Science
Richard Monastersky	Earth Sciences
Ron Cowen	General Science
Carol Ezzell,	Life Sciences/ Biomedicine
Kathy A. Fackelmann	
Ivars Peterson	Mathematics/Physics
Jonathan Eberhart	Space Sciences
Larry Norland	Editorial Assistant
Wendy Gibbons, Tim Walker	Science Writer Interns
Liz Marshall	Books/Resource Manager
Donald R. Harless	Advertising/Business Manager

SCIENCE NEWS (ISSN 0036-8423) is published weekly on Saturday, except the last week in December, for \$34.50 for 1 year or \$58.00 for 2 years (foreign postage \$6.00 additional per year) by Science Service, Inc., 1719 N Street, N.W., Washington, D.C. 20036. Second-class postage paid at Washington, D.C., and additional mailing office. **POSTMASTER:** Send address changes to SCIENCE NEWS, 231 West Center Street, Marion, OH 43305. Change of address: Four to six weeks' notice is required—old and new addresses, including zip codes, must be provided.

A question of speed

"Since its launch on Oct. 18, 1989, Galileo has sped through an intricate route of speed-increasing gravity maneuvers that have already whipped the craft around Venus and Earth," according to "Space Science '91" (SN: 1/12/91, p.28). The article goes on to state that "Galileo should whip by Gaspra at a relative top speed of more than 28,800 kph. . ."

Top speed relative to what? Earth? Gaspra? If the latter, Galileo, with a speed of 159,000 kph (see below), would have to be overtaking Gaspra to have a speed differential of only 28,800 kph. Gaspra's orbital speed would be 130,200 kph—greater, even, than that of Venus.

According to an earlier article, "Venus gives Galileo a boost in space" (SN: 2/24/90, p.119), Galileo, after swinging by Venus and Earth, has a speed (I assume relative to the Earth) of about 159,000 kph (134,000 kph after leaving Venus, plus 25,000 kph from the Earth flyby).

Now, any speed increase attributable to a planet flyby must be from the orbital speed of the planet, not the gravitational attraction,

Science Service Institution for the public understanding of science founded 1921; a nonprofit corporation.

Board of Trustees—Chairman, Glenn T. Seaborg; Vice Chairman, Gerald F. Tape; Treasurer, Willis Harlow Shapley; Joseph W. Berg Jr.; Robert W. Fri; David A. Goslin; J. David Hann; Milton Harris; Leon M. Lederman; Shirley M. Malcom; Elena O. Nightingale; Ben Patrusky; H. Guyford Stever; Sanford J. Ungar; Deborah P. Wolfe.

Honorary Trustees—Edward Bliss Jr.; Bowen C. Dees; O. W. Riegel; John Troan.

President: E. G. Sherburne Jr.; Business Manager: Donald R. Harless.

because gravity in equals gravity out. How does Galileo gain speed on its second Earth flyby if its speed is already 159,000 kph and Earth's orbital speed is only 107,192 kph?

Howard P. Caudle
Webster, N.Y.

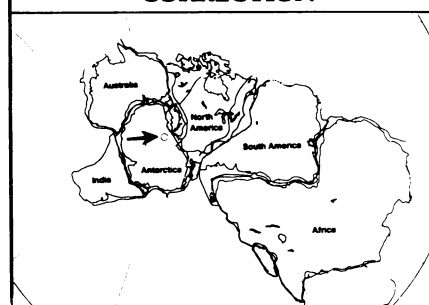

In short, Galileo gained speed on the way to Venus, since the spacecraft was "falling" into the sun's "gravity well," but is now slowing down on its way out. In fact, on Jan. 11, 1992, when the craft reaches its most distant point from the sun after rounding the asteroid (about three months after the actual asteroid flyby) and prepares to start "falling" sunward again, its speed will have dropped to only 53,700 kph.

Galileo will be able to reach that point because of the speed it gained during the Feb. 10, 1990, Venus flyby and the Dec. 8, 1990, Earth flyby. Galileo's route was designed to give it enough net speed to reach its primary objective at Jupiter, but the complex trajectory involves speeding up on the way to Venus, then losing some of that gain on the outbound trip past Earth to Gaspra, and accelerating again as a result of heading back toward Earth. Thus, Galileo will not reach the

159,000 kph speed you mention. Its maximum speed, about 146,000 kph, was achieved about two weeks after the Venus flyby, when the craft came closest to the sun.

— J. Eberhart

CORRECTION

IAN W.D. DALZIEL

In this map from "Married to Antarctica" (SN: 4/27/91, p.266), a printing error omitted the circle showing the present-day position of the South Pole. The map depicts a possible arrangement of continents around 675 million years ago.
