THE SCIENCE OF ART

Optical themes in western art from Brunelleschi to Seurat

"This large, beautifully produced and illustrated book is . . . for those who are tired of woolly generalizations on art and pictures. The Science of Art has a rare depth and range of scholarship which includes fascinating details of techniques and devices with carefully expressed insights on the perceptual problems of the artist and the role of the viewer."

— Richard L. Gregory, *Interdisciplinary Science Reviews*

For almost five hundred years the central goal of European painting was the imitation of nature. Many artists and theorists, believing that imitation must be based on scientific principles, found inspiration or guidance in two branches of optics — the geometrical science of perspective and the physical science of color. In this pathbreaking and highly illustrated book, Martin Kemp examines the major optically orientated examples of artistic theory and practice from the Renaissance to the nineteenth century. He not only adds to our understanding of a large group of individual works of art but also provides valuable information for all those interested in the interaction between science and art.

"A whirlwind tour of relativity, thermodynamics, quantum mechanics, chaos and more. . . . The book proves to even the scientifically ignorant that science itself can be a labor of love."

— The Boston Globe

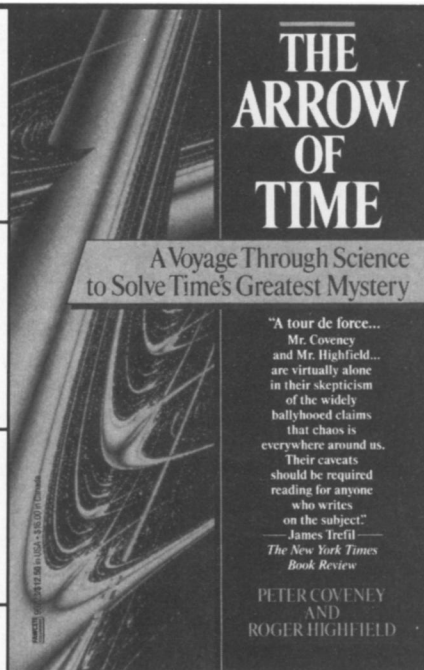

"[An] extraordinary book. . . . A work of theoretical synthesis, imaginatively written for an intelligent lay audience, that comes to a brain-wrenching conclusion."

— The Washington Post Book World

"Straightforward . . . Scholarly . . . Intellectually rich . . . The book manages to capture the excitement and puzzlement of time."

In *The Arrow of Time*, a major bestseller in England, Dr. Peter Coveney, a research scientist, and award-winning journalist Dr. Roger Highfield demonstrate that the commonsense view of time agrees with the most advanced scientific theory. Time does in fact move like an arrow, shooting forward into what is genuinely unknown, leaving the past immutably behind. The authors make their case by exploring three centuries of science, offering bold reinterpretations of Newton's mechanics, Einstein's special and general theories of relativity, quantum mechanics, and advancing the insights of James Gleick's *Chaos*.

A FOREST OF KINGS

THE UNTOLD STORY OF THE ANCIENT MAYA

LINDA SCHELE
AND
DAVID FREIDEL

Morrow, 1990, 542 pages,
7" x 10", paperback, \$15.00

The recent interpretation of Maya hieroglyphs has given us the first written history of the New World as it existed before the European invasion. *A Forest of Kings* is the story of Maya kingship, from the beginning of its institution and the first great pyramid builders two thousand years ago to the decline of Maya civilization and its destruction by the Spanish. Here the great historic rulers of Precolumbian civilization come to life again with the rediscovery of their language. At its height, Maya civilization flourished under great kings like Shield-Jaguar, who ruled for more than sixty years, expanding his kingdom and building some of the most impressive works of architecture in the ancient world. Long placed on a mist-shrouded pedestal as austere, peaceful stargazers, the Maya elites are now known to have been the rulers of populous, aggressive city-states.

Kingship was the primary political and religious institution of the ancient Maya and unified the Maya view of art, politics, war and religion. The Maya were at once highly civilized, skilled in architecture and astronomy, and, to us, violent and barbaric, engaging in ritual bloodletting and many wars.

The true artistry of the Maya glyphs and artifacts is evident in the 24-page color section. In addition, Maya history is brought clearly to life through the more than 250 illustrations, maps and charts that are found throughout the text.
