RAPID MATH TRICKS AND TIPS

30 DAYS TO NUMBER POWER

Edward H. Julius

With Ed Julius' thirty-day Number Power Program, you'll learn how to whiz through common (and some not so common) math problems without a calculator. In fact, with the fun, easy-to-learn techniques in this book, you'll be able to master difficult problems in addition, subtraction, multiplication, and division — often in less time than it takes to use a calculator! For example, you can multiply any two-digit number (let's say, 45) by 11 simply by splitting apart the two digits, adding them, and then putting the sum in the middle ($45 \times 11 = 495$ because $4 + 5 = 9$). It's that easy!

A great book for math lovers, *Rapid Math Tricks and Tips* is also a godsend for students, teachers, or just about anybody who uses numbers on a regular basis.

THE New Physics

Edited by Paul Davies

"Non-scientists will get a good sense of some of the new ideas, and scientists — physicists included — can learn how very far physics has extended its dominion." — Nature

This widely acclaimed book comprises a sweeping survey of developments throughout the whole of modern physics. All of the major topics at the frontiers of the subject have been covered in this collection of reviews, each written by one of the leading figures in the field.

Whether you wish to know about the ultimate building blocks of matter, the structure, origin, and evolution of the Universe, quantum gravity, low temperature physics, optics and lasers, chaos and complexity, or the foundations of quantum mechanics, you will find the answer here. Aimed at scientists and non-scientists alike, the articles in this book are profusely illustrated with color photographs and clear explanatory diagrams. To ensure that it will appeal to a wide range of readers, the book has been meticulously edited by Professor Paul Davies, well known for his ability to communicate advanced topics to the non-specialist.

There is no better one-volume guide to what is happening in modern physics. Anyone interested in learning about what is happening in all fields of modern physics, whether a trained scientist or not, will find this a fascinating treasurehouse of information.

Cosmos, the widely acclaimed book and television series by Carl Sagan and Ann Druyan, was about where we are in the vastness of space and time. *Shadows of Forgotten Ancestors* is an exploration of who we are.

"We humans are like a newborn baby left on a doorstep," they write, "with no note explaining who it is, where it came from, what hereditary cargo of attributes and disabilities it might be carrying, or who its antecedents might be." This book is one version of the orphan's file. Sagan and Druyan take us back to the birth of the Sun and its planets and the first stirrings of life; to the origins of traits central to our current predicament; sex and violence, love and altruism, hierarchy, consciousness, language, technology, and morality.

Many thoughtful people fear that our problems have become too big for us, that we are for reasons at the heart of human nature unable to deal with them, that we have lost our way. How did we get into this mess? How can we get out? What is male and female? Why are we so anxious to distance ourselves from the other animals? Is there something within us that condemns us to selfishness and violence? When Sagan and Druyan first undertook this exploration it was "almost with a sense of dread. We found instead reason for hope."

This book presents important ideas with the clarity for which the authors are famous. Daring, passionate, with a breathtaking sweep, *Shadows* is a quest for a new perspective—one that integrates the insights of science into a vision of where we came from, who we are, and what our fate might be. —from the publisher

"One of those rare books that are so profoundly exciting they raise the hairs on the back of your neck."

—James Burke, *The Day the Universe Changed*

The Evolution of Consciousness will change the way you think about your mind. Robert Ornstein introduces his panoramic history of the mind's evolution by explaining that we are not rational, but adaptive. The mind, like our bodies, evolved to help us survive — avoid danger, procure food, and perpetuate the species — not to reason why. Our mind still contains within itself not two hemispheres, but a phalanx of adaptations to circumstances. Passionate, entertaining, and provocative, *The Evolution of Consciousness* is nothing less than a fundamental challenge to our assumptions about the human mind and how it works. —from the publisher
