

Books

Books is an editorial service for readers' information. To order any book listed or any U.S. book in print, please remit retail price, plus \$2.00 postage and handling charge for each book, to **Science News Books**, 1719 N St., N.W., Washington, DC 20036. To place Visa or MasterCard orders, call 1-800-544-4565. All books sent postpaid. Domestic orders only. Please allow 4-6 weeks for delivery.

Earth Work: Resource Guide to Nationwide Green Jobs — Joan Moody and Richard Wizansky, eds. For anyone with an interest in conservation or an environmental career, including those just starting out or looking for a change, Moody and Wizansky discuss what degrees to pursue and from which universities, how to garner experience, and how to find a job in areas from fieldwork to desk jobs. Profiles of people already in the field and numerous listings of prominent organizations and types of jobs available, including the "hot" ones, are also included. HarpCWest, 1994, 205 p., paperback, \$14.00.

The Essential Guide to Prescription Drugs: 1995 Edition — James W. Long and James J. Rybacki. The authors examine more than 300 of the most commonly prescribed drugs in profiles that include brand and generic names; principle uses; how they work; dosing information; general precautions and special precautions for pregnant women, children, and the elderly; and side effects. Chapters about drugs for specific ailments, drug classes, terminology, and side effects and certain pharmaceuticals that cause them round out the volume. HarperPerennial, 1994, 1,151 p., color plates, paperback, \$18.00.

The Intelligence of Dogs: Canine Consciousness and Capabilities — Stanley Coren. A psychologist and renown dog trainer presents his theories about canine intelligence, elaborating on the capabilities of different breeds, ranking their mentality, and evaluating canine methods of communication through body language and speech. Methods for helping a dog reach its mental potential through an IQ test and a thorough review of the three facets of canine intelligence — instinctive, adaptive, and linguistic — provide a wealth of insight about how to understand and train a dog. Free Pr, 1994, 271 p., b&w illus., hardcover, \$22.95.

Minerals: An Illustrated Exploration of the Dynamic World of Minerals and Their Properties — George W. Robinson. Four sections representing the most influential geologic forces in the genesis of minerals — magmatism, precipitation from solution, chemical alteration, and recrystallization — provide a framework for categorizing mineral crystalline shapes, structures, colors, and textures. Stunning color photographs enhance the text, which further identifies different groups of rocks, including igneous, carbonatites, and pegmatites, and discusses water's role in mineral formation and the chemical alteration of minerals. S&S, 1994, 208 p., color photos and illus., hardcover, \$40.00.

Sleep Right in Five Nights: A Clear and Effective Guide for Conquering Insomnia — James Perl. Beginning with a discussion of such sleep problems as snoring, sleepwalking, and narcolepsy, the author examines the causes of insomnia and aims to provide a better understanding of sleep patterns. In the second half of the book, he helps the individual solve his or her problems by making use of information gleaned from research done by the American Sleep Disorders Association. Relaxation techniques, nutrition, exercise, the effects of sunlight on sleep, aging, depression, medications, and many other factors affecting sleep are covered. Originally published in hardcover in 1993. Quill, 1994, 320 p., paperback, \$10.00.

We Are Not Alone: The Continuing Search for Extraterrestrial Intelligence — Walter Sullivan. Though bearing the same title as Sullivan's 1964 classic, this is essentially a new book, which details more than three decades of efforts by serious scientists to pick up messages from intelligent life beyond the solar system. Initially little more than a probability argument by a few physicists and astronomers, the search for ETs has gained greater respectability as the result of findings in a variety of disciplines. Here Sullivan sums up the evidence for life elsewhere in the universe — quite compelling to some — and assesses such questions as: Is our universe unique? Is life inevitable? Have UFO's visited Earth? And he examines the profound ramifications for humans if ever we make contact with an alien culture. Plume, 1994, 354 p., b&w photos and illus., \$12.95.

paperback, \$11.95

Bob Berger is the expert when it comes to risk assessment. Now he tells how to use the secrets the professionals already know—probability theory, game theory, and the fascinating tool called the 2-by-2 box matrix—to get the edge in every decision you make and to be a winner in life.

It's fun-and profitable-to know how to beat the odds at casino gambling or buying stocks. But it may be a matter of life and death to understand the margin of error in a medical diagnosis, the occupational hazards in the job you choose, and the chances of injury in playing your favorite sport.

At home or on the job, from the big choices to the scores of small ones you make every day, Bob Berger shows how to be wiser in all that you do...and how to help make your dreams come true.
