Basic Books, 1994, 206 pages, 5 1/4" x 8", paperback, \$12.00

"Assume the cow is a sphere." So begins this lively, irreverent, and informative look at physics and how physicists think. Rich with anecdotes and accessible examples (like the cow as sphere, which illustrates the principle of simplifying the world in order to explain it), **Fear of Physics** nimbly ranges over the tools and thought behind the scientific method, taking the mystery out of what is essentially a very human intellectual endeavor.

In six fun-filled chapters that include a discussion of the ideas and tricks of everyone from Plato to Marshall McLuhan to Stephen Hawking, Krauss brings his enormous talents as a master teacher to this subject. Among the topics he treats are how to handle the "art" of numbers, how physicists define truth, how and when to plagiarize creatively, and much more.

Imagine a world where a taste has shape, a sound has color, and a smell can be touched... In 1980, psychoneurologist Richard Cytowic was astonished when his neighbor told him that he actually saw — and felt — a smooth, cool cylinder of glass whenever he tasted mint. Soon after, Dr. Cytowic met a woman for whom sounds had color, whose husband's voice was "a wonderful golden brown."

This commingling of the senses — called *synesthesia* — affects only ten in a million people. What exactly is happening when they feel these sensations? Is there a physical explanation for synesthesia? And what does it mean for the rest of us?

In the tradition of Oliver Sachs's bestselling *The Man Who Mistook His Wife for a Hat*, *The Man Who Tasted Shapes* delves into this most bizarre medical mystery. And as it unearths astounding discoveries about the brain, it also compels us to rethink our deepest beliefs about reason, emotion, the nature of perception, and the roots of creativity.
