

Even harder than doing great science... is explaining it.

That's what *The Science Masters Series* does.

These short, easy-to-read, attractive books present cutting-edge ideas in a format that will enable a broad audience to attain scientific literacy. Here is a platform from which leading scientists in a range of disciplines, from astrophysics to zoology, can communicate their ideas to general readers.

— from Basic Books

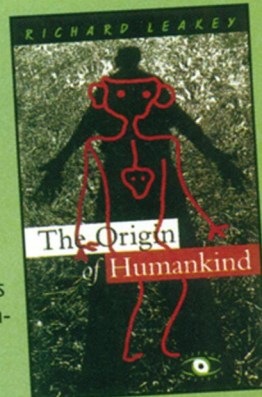

The *Last Three Minutes*, by Paul Davies, combines the latest and most scientifically sound thinking about the ultimate fate of the universe with vivid scenarios of how it will feel to those of us still around when the end comes.

Look, if you will, past that last day of sunlight into perpetual night. Experience the onset of stardoom — when the nuclear energy of burning stars is finally exhausted. Journey through those eons of time when black holes are the last major source of energy, devouring the scattered remnants of burnt-out galaxies.

Will this be the stage on which cosmic life plays out its final act? Or is the universe destined to end very differently and in the much less distant future, overwhelmed by a sudden and unexpected cosmic catastrophe? Indeed, will the universe end at all?

Deriving its power from Richard Leakey's unquestioned authority in the field of paleontology, *The Origin of Humankind* answers the question: What made humans human? Leakey argues that when one of our hominid ancestors acquired the ability to walk upright, the evolution of modern humans became possible, perhaps even inevitable. All other human evolutionary refinements and distinctions can be seen as related to this one dramatic step.

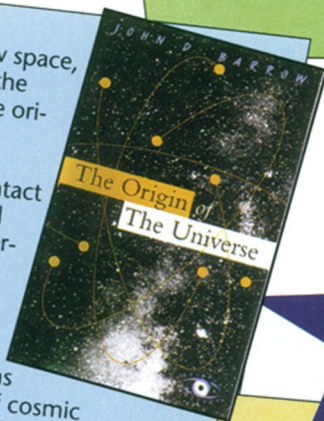

In fascinating sections on how and why modern humans developed a social organization, culture, and personal behavior, Leakey enhances our understanding of the nature and evolutionary role of art, language, and human consciousness.

There is no more fascinating question than that of how space, matter, and even time began. Now Barrow, explains the complex physical processes that we now know govern the origin of the universe.

Here, he describes what makes cosmology possible. He shows how scientists, by exploring crucial points of contact between the behavior of matter during its early history and the observed structure of the universe today, came to understand more fully all the entities in the universe — from elementary particles to great clusters of galaxies.

Moving to the frontier questions of modern cosmology, Barrow discusses how to understand whether time had a beginning; why scientists feel there may be extra dimensions to space; and what may be the remarkable consequences of cosmic wormholes. He also shows why the discoveries made by NASA's COBE satellite are of such paramount importance.

Filled with absorbing, at times alarming, stories about the world of bees and orchids, "designed" eyes and human ancestors, *River Out of Eden* answers tantalizing questions: Why are forests trees tall — wouldn't each survive more economically if all were short? Why is the sex ratio fifty-fifty when relatively few males are needed to impregnate many females? Why do we inherit genes for fatal illnesses?

By "reverse engineering," he deduces the purpose of life ("God's Utility Function"). Hammering home the crucial role of gradualism in evolution, he confounds those who argue that every element of, say, an eye has to function perfectly or the whole system will collapse.
