paperback, \$15.95

Hip, multicultural, and funny, THE CARTOON HISTORY OF THE UNIVERSE I and II has something for absolutely everyone. Both enormously edifying and wildly entertaining, it's a course in history that's in a class by itself.

The first edition traverses 13 billion years of history from "The Evolution of Everything" to "Brains and Bronze" to "All About Athens."

The brand-new second edition contains six more hilarious volumes, which pick up from where the last book leaves off and continues through 600 A.D. Some volumes included here are "Is Everything Sacred? —the story of ancient India," "Jaded Princes — Chin and Han Dynasties," and "Render Unto Caesar."

In these confusing times, health care questions are more important than ever. More and more, Americans are turning to the People's Medical Society — a consumer advocacy group — for answers.

Now the Society has written *The Consumer's Medical Desk Reference*, providing the most complete information ever for an entire spectrum of health concerns — far beyond mere symptoms and treatment. This guide provides hard-to-find answers to many health questions — from phone numbers to specific groundbreaking information on illnesses, from medical rights to information on unnecessary operations, from second opinions to specific drugs and their uses. In this book is everything you need to know to make an informed decision about your health care, including:

- A glossary of 101 major medical conditions
- How to understand and protect your legal and medical rights
- The most common prescription drugs and their possible side effects
- The major body systems, how they work, and the most common problems of each
- Important criteria for choosing a doctor

Carefully forming analogies that present the mysteries of life in terms as familiar as the letters of the alphabet, Christian de Duve, the Nobel Prize-winning biochemist, guides us on a wondrous journey through the past four billion years. From the formation of the first biomolecules to the complexities of the human mind, from microscopic chains of amino acids and nucleotides to cataclysmic events in distant galaxies, he arrives at the compelling conclusion that the universe is strewn with "vital dust" capable of spawning life anywhere under the right conditions. Life and mind are not accidents; they are natural manifestations of matter.

At the heart of *Vital Dust* is the concept of seven increasingly complex "ages" of life on Earth. With each age, de Duve shows the key event that defined the age and the new event that led to the next. He argues that simple, deterministic chemical reactions put life on track but that other mechanisms led inexorably to greater complexity and biodiversity: the development of a lock-and-key system that serves as the universal device of biological recognitions at the molecular level; the emergence of a common ancestor of all organisms, from amoebas to humans; the great oxygen holocaust; the conversion of some bacteria into complex cells; and the successive improvements in reproductive strategies that made possible the spectacular diversity of life on Earth.

Provocative and powerfully argued, *Vital Dust* is one of the most important science books to come along in some time.

Who was the first king of ancient Egypt — and who was the last? Which Egyptian queens ruled in their own right? What do we really know about the 170 or more pharaohs whose names have come down to us?

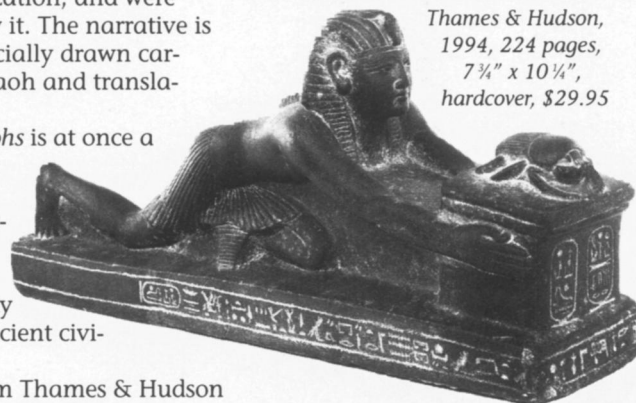

Chronicle of the Pharaohs is the first book to set down in narrative form, using timelines and other visual aids throughout, all the rulers and dynasties of Egypt in their chronological order.

The biographical portraits of each pharaoh build into a comprehensive and immensely readable history of ancient Egypt, brought to life through the exploits and personalities of her rulers. From Narmer, who first united the lands along the Nile, to Cleopatra some 3,000 years later, we see the way in which individual pharaohs helped to shape Egyptian civilization, and were themselves shaped by it. The narrative is supplemented by specially drawn cartouches of each pharaoh and translations of their names. *Chronicle of the Pharaohs* is at once a book to be enjoyed as popular history, an essential work of reference, and a visual introduction to the extraordinary diversity and richness of an ancient civilization.

Analyzing Data?

JMP® Version 3.1

Statistical Discovery Software

JMP Version 3.1 features:

- complete analytical capabilities
- exceptional data visualization
- statistical quality control charting
- integrated design of experiments
- robust modeling facilities
- powerful survival analyses

JMP makes data exploration simple by presenting a graph with almost every statistic! JMP Version 3.1 is available for Windows™ 3.1 or later, Windows NT™, 680x0 Macintosh® & Power Macintosh™.

Classroom-tested science projects and hard-to-find advice on all aspects of science fairs

IF YOU'RE LOOKING FOR MORE THAN JUST A science fair project book, this unique insightful guide is one you'll want to buy. Focusing on an elementary school audience, *Getting Started in Science Fairs: From Planning to Judging* lives up to the promise of its title, providing not only complete descriptions of dozens of creative projects, but also all of the necessary information for staging and judging science fairs. Respected educator Phyllis J. Perry provides teachers, parents, students, and science fair organizers and judges with helpful advice on everything from setting science fair objectives to what roles adults should play.

Broader in scope than other books, this guidebook's projects—all of which follow the scientific method—span nine different scientific disciplines, including botany, environmental science, and zoology. For each project, Perry thoroughly explains its objective, and describes procedures for set-up and data gathering, as well as offering helpful suggestions for how to effectively display the project at a science fair. You'll also find a resource section filled with information on materials and supplies.
