If you are the parent of a young child, you know that a love of science and nature can open up worlds of learning and enjoyment. You want to teach your child to appreciate these subjects and to approach them eagerly, but how do you start? These brand-new guides show 100 great ways! Created by two top educators, each book presents 50 fun, simple, parent-child activities that can help your child develop a lifelong love of science and the environment. For each activity, easy-to-follow instructions tell you what to do, what materials you'll need, and how to encourage your child to want to find out more. In the *Math* book, you'll learn how to find practical uses for math in everyday activities and be furnished with sample problems and easy-to-understand explanations for older children as well. Lists of references aid you in guiding your child along the path of learning.

How would you decide?

- You're at the casino—you've doubled your money and you're still on a roll. Is it time to quit?
- You meet someone close to perfect. Should you stop searching or hold out for someone even better?
- Your well-diversified mutual fund is performing nicely, but suddenly your broker calls about a hot stock offering. Should you invest?

Drawing on scores of research findings and examples, H.W. Lewis presents brain-teasing problems and amusing scenarios that reveal clever ways to avoid the anxiety associated with making decisions.

Inviting readers to play "The Dating Game," he shows how to make a fateful decision when you don't yet know all your options. He shows how to weigh the intentions of hostile competitors and effectively anticipate their next moves.

Lewis points out the mistakes people so often make when facing a wide variety of decision-making pressures and shows how to organize your thinking to achieve a clear state of mind when confronting any particular decision.

You'll be amazed as Lewis examines how electoral systems can be manipulated to skew the results; how the concept of the random walk applies to the stock market; and how understanding standard deviation and regression can lead to better predictions in both personal and professional life.
