## ARCHAEOLOGY

### Finds Explain Visby

Why the beautiful little city of Visby in the Swedish island of Gothland held such unusual commercial power in the Middle Ages has at last been accounted for by archaeological finds. Excavations in the northern part of the town recently yielded important remains of extensive iron works. From the evidence archaeologists have concluded that during the Middle Ages and possibly even by the end of the Viking Age, Visby was a center for the smelting and refining of iron and copper, which industry contributed greatly to its prosperity.

Pieces of iron ore found indicate that the ore used at the Visby works was imported from Utoe Island, near Stockholm, according to John Nihlen, Swedish archaeologist, writing in *Art and Archaeology*.

"Thousands of large slag lumps prove the ore had been melted in furnaces," he states. "Numerous objects of iron also indicate that skilled blacksmiths worked the metal. Finally, certain circumstances seem to show that the people of Gothland during this period exported wrought iron to neighboring countries."

"Existence of this iron trade has hitherto been quite unknown," Mr. Nihlen states. "Only the name of the street where the industry was located, Smedjegatan or the Smiths' Street, contains a memory of the time when iron was worked on a large scale in these outskirts of the town."

Visby has been inhabited since a Stone Age period, some 7,000 years ago, and excavations there have revealed innumerable relics of its history through different centuries. Its far-reaching trade relations as its commercial prosperity grew is shown by such articles as a cup made in China and a sea-shell from the Indian Ocean, found in graves dating from the Iron Age.

## PHYSICS

ALBERT ABRAHAM MICHELSON

### Time Keeper On Light

When an athletic coach wants to see how fast a runner can go, he measures the time it takes him to run a known distance, and when Prof. Michelson wanted to see how fast the messenger which brings us knowledge of the most distant stars and galaxies—a beam of light—travels, he timed it between two California mountain peaks. And by his results we know that in a single second a beam of light will travel 299,796 kilometers.

Many years ago, in a classical series of experiments, he started the train of thought which finally produced the theory of relativity; a new standard for measurement was given the world when he determined the length of the meter in terms of an invariable wave length of light; and his interferometer has made possible measures of the diameters of some of the largest stars. All these achievements have brought him many honors, including the Nobel Prize in Physics, and the presidency of the National Academy of Sciences, which meets in Washington next week, April 25 to 27.

## ELECTRICITY

### New Electrical Insulator

Cheaper electric lights and less expensive electrical heating are possible outcomes of recent work on electrical insulations by a group of Russian scientists, under the leadership of Dr. Abram Joffe, head of the Physical-Technical Institute of Leningrad.

Dr. Joffe describes his researches on a new type of insulating material, which scientists believe may revolutionize the whole aspect of high-power transmission problems, in the *Journal of Mathematics and Physics* of the Massachusetts Institute of Technology. As a result of this work, entirely new ways of manufacturing electrical insulators may be opened up.

He has found that a very thin layer of a comparatively cheap and readily available varnish-like material substitutes for the large bulky porcelain insulators now used. Investigation of the dependence of dielectric strength; that is, the resistance to electrical puncture or breakdown on the thickness of a sample has shown that considerable potentials can be insulated by very thin films, their dielectric strength approaching the tremendous figure of 100,000,000 volts per centimeter of insulator thickness.

In addition to giving the electrical industry a new insulating material, Dr. Joffe's work gives the experimental physicist a new method of subjecting materials to immense pressures. When the electrical current is in a wire it creates pressure at the wire's surface in trying to get out. Since Dr. Joffe's new insulating material resists the electricity's efforts for freedom more strenuously than other materials, greater pressures are created at the surface of the conductor than ever before obtained. He has obtained the extraordinary pressure of 300,000 atmospheres, some 4,500,000 pounds per square inch. The highest pressure previously obtained in scientific work

### New Insulator

(Continued from page 253)

has been 40,000 atmospheres, secured by Prof. P. W. Bridgman of the physics department at Harvard. Since such high pressures squeeze the atoms of the metal tighter together than ever before, it is predicted that new knowledge about the properties of matter, especially the spacing of the atoms, will result.

In high voltage power transmission, high potential currents are likely to flash from pole to pole to other wires, and sometimes to the ground. To prevent this, there are used high towers equipped with crossarms that hold the wires a considerable distance apart, suspended from costly porcelain insulators. With the new methods it may be possible to reduce the size of the insulators, so that the wires can be laid in conduits, thus doing away altogether with the expensive pole construction in use at present.

Dr. Joffe has been studying the problem of electrical insulation for many years and is at present engaged in giving a course of lectures on the electrical and elastic properties of solids in the department of physics at the University of California. American physicists are of the opinion that Dr. Joffe's new discoveries, when more completely developed, will have not only the highly desirable practical results of making electrical heating and lighting cheaper, but will be invaluable in the branches of engineering and physics that employ high voltages.

Science News-Letter, April 23, 1927

In 1913 there were 6 rubber manufacturers in Japan; now there are 180.

The house shortage in Germany is held responsible for some mental disease.

### News-Letter Features

Born over four years ago of the demand and interest of those individuals who had caught a glimpse of *Science Service's* news reports to newspapers, the SCIENCE NEWS-LETTER has since proved interesting to laymen, scientists, students, teachers and children.

Into the pages of the NEWS-LETTER are fed the cream of *Science Service's* output directed at the newspapers of the world. To this is added material especially prepared.

Turn the pages and note:

It is a *separable magazine*. You can clip or tear out any article without losing or damaging another article on the other side.

Each article is automatically *indexed* by the key word printed above its heading. Articles can thus be filed easily into any system of classification.

Each article is automatically *dated* by its last line.

The current *news* of science, reported for *Science Service* by its own staff and correspondents throughout the world is presented and commented upon in each issue.

Books are *reviewed in brief* as they are received from the publishers.

*The classics of science* and striking passages from current books, addresses and periodicals are carefully selected and published.

Important *anniversaries* of science are appropriately noted week by week in a special department.

Regular articles tell of the happenings in the *skies* and in the great *outdoors*.

*Photographs* aid in the telling of the week's science.

Great care is taken to keep its editorial content not only *interesting* but *accurate* as to fact and implication.

The *Science News-Letter* is **copyrighted and is sold with the understanding that it is for personal, school, club or library use only. Publication of any portion is strictly prohibited.**

SCIENCE NEWS-LETTER, The Weekly Summary of Current Science. Published by Science Service, Inc., the Institution for the Popularization of Science organized under the auspices of the National Academy of Sciences, the National Research Council and the American Association for the Advancement of Science.

Publication Office, 1918 Harford Ave., Baltimore, Md. Editorial and Executive Office, 21st and B Sts., N. W., Washington, D. C. Address all communications to Washington, D. C.

Entered as second class matter October 1, 1926, at the postoffice at Baltimore, Md., under the act of March 3, 1879. Established in mimeograph form March 13, 1922. Title registered as trade-mark, U. S. Patent Office.

Subscription rate—\$5.00 a year postpaid. 10 cents a copy. Ten or more copies to same address, 6 cents a copy. Special reduced subscription rates are available to members of the American Association for the Advancement of Science.

Advertising rates furnished on application.

Copyright, 1927, by Science Service, Inc. Reproduction of any portion of the SCIENCE NEWS-LETTER is strictly prohibited since it is distributed for personal, school, club or library use only. Newspapers, magazines and other publications are invited to avail themselves of the numerous syndicate services issued by Science Service, details and samples of which will be gladly sent on request.

Staff of Science Service—Director, Edwin E. Slosson; Managing Editor, Watson Davis; Staff Writers, Frank Thone, James Stokley, Emily C. Davis, Marjorie MacDill; Sales and Advertising Manager, Hallie Jenkins.

Board of Trustees of Science Service—Representing the American Association for the Advancement of Science, J. McKeen Cattell, *Vice-President and Chairman of the Executive Committee*, Editor, Science, Garrison, N. Y.; D. T. MacDougal, Director, Desert Laboratory, Tucson, Ariz.; M. I. Pupin, Professor of Electromechanics, Columbia University, New York City. Representing the National Academy of Sciences, John C. Merriam, President, Carnegie Institution of Washington; R. A. Millikan, Director, Norman Bridge Laboratory of Physics, California Institute of Technology, Pasadena, Calif.; A. A. Noyes, Director, Gates Chemical Laboratory, California Institute of Technology, Pasadena, Calif. Representing National Research Council, Vernon Kellogg, *Treasurer*, Permanent Secretary, National Research Council, Washington, D. C.; C. G. Abbot, Director, Astro-Physical Observatory, Smithsonian Institution, Washington, D. C.; Victor C. Vaughan, Professor Emeritus of Hygiene, University of Michigan. Representing Journalistic Profession, John H. Finley, Associate Editor, New York Times; Frank R. Kent, Baltimore Sun; Mark Sullivan, Writer, Washington, D. C. Representing E. W. Scripps Estate, W. E. Ritter, *President*, University of California; Robert P. Scripps, Scripps-Howard Newspapers, West Chester, Ohio, Thomas L. Sidlo, Cleveland, Ohio.
