

SCIENTIA INTERNATIONAL

NOVAS DEL MENSE IN INTERLINGUA

► **Medicina.**—Un gruppo de scientistas austriani ha apparentemente trovate un solution del problema de como le droga isoniazido exerce su famose effecto benefic super tuberculose. Illo non affice le germines directemente sed solmente post combinar se con un metallo in un composto del typo cognoscite como chelatos. Le chelato de isoniazido e cupro se monstrava multo destructive pro germines tuberculosi, tanto in vitro como etiam in animales experimental. In iste forma le droga es extrememente toxic, e on suppose que in le corpore human isoniazido non se combina con cupro sed con un altere metallo que es non ancora identificate.

► **Physiologia.**—Dr. S. F. Cook del Universitate California ha observeate dece-duo consecutive generaciones de muses a un altitude de 3300 m e sex generaciones in un camera a pression reducite que simulava un altitude de 5000 m. Le musculos devencia plus o minus sterile, sed alteramente illes remaneva relativemente normal. Le femininas se degenerava plus generalmente. Illas abortava frequentemente, e le crescentia del prole esseva retardate. Post renormalizar le pression atmospheric del ambiente, Dr. Cook trovava que su muses reatingeva un quasi complete normalitate intra un sol generation.

► **Agronomia.**—Insectos del genere *Coccinella* es importate ab India a Florida pro assister le agri- e horticultores de ille stato nord-americano in lor lucta contra aphides e altere pestes destructive de fructos e vegetales. Le specie *Bromus* ha jam provate su valor. Nunc on experimenta con *Chilomenes* que ha un duration de vita de solo septe septimanias sed que pote reproducer se rapidissimamente e que se distingue per un enorme voracitate. On ha trovate in experimentos laboratorial que un sol individuo de iste genere devorava 16,321 aphides in le curso de sex septimanias.

► **Medicina.**—Le alimentation via tubos que descende a transverso le esophago usque al stomacho o mesmo al intestinos es grandemente simplificate per un typo de pumpa disveloppate per Dr. J. Barron de Detroit. Le pumpa pote relentar le intubation de un litro de alimento de maniera que illo require usque a dece horas o pote accelerar le processus de maniera a completar lo in trenta minutus.

► **Medicina.**—Ric reservas de vitamina B-12, que es importante pro prevenir anemia, se trova in le hepat. Le analyse del contento de B-12 in le hepates de 132 mortos autopsiate ha permittite a observatores al Universitate California concluder que le hepat normal ha reservas de B-12 sufficiente pro satisfacer le requirements del corpore durante un periodo de tres annos.

► **Agronomia.**—Specialistas del statounitese Centro de Recercas Agricole ha disveloppate duo lineas de gallinas ab duo gruppis de ancestres de racia identic sed de pesos median del glandula thyroide de 32,8 e 18,2 mg, respectivamente. Per elevar le duo lineas sub identic conditions on spera clarificar le question del influentia del thyroide super le production de carne e ovas.

► **Psychologia Animal.**—Chimpanzes, como infantes human, ama jocar con jochettos. Como infantes human illos prefere nove jochettos. Illos prefere jochettos ronde a jochettos angular. Illos es specialmente attrahite per colores brillante. Al etate de tres o quattro annos illos es plus interessate in jochettos que a duple iste etate.—Observations de Dr. W. I. Welker del Laboratorios Yerkes in Florida.

► **Aeronautica.**—In certe typos de aviones de combatto le atterrage e etiam le partita es rendi-

te difficultissime e mesmo pericolose per le presenta de un longe e acute "naso" que protrude ante le cabina e obstrukte le campo de vision del pilota. Un inventor britannic ha nunc patentate su plano de construer tal aeroplano con un naso que le pilota pote abassar pro departir o atterrare. Durante le volo le naso es elevate in le position normal que da a iste aviones le aere de pisces gladio.

► **Astronautica.**—In experimentos preparatori de "medicina astronautic" on ha constatare que muses que habeva essite lanceate a altitudes de inter 35 e 40 km disveloppava un numero median de dece-un capillos blanc, in contrasto con tres capillos blanc trovate super muses de controllo sin experientia astronautic. Iste effecto debe esser le resultado del destruction o inactivatione de cellulas pigmentari in le folliculos del capillos, effectuate per le impacto del radiation cosmic.

► **Ornithologia.**—Experimentos con columbas messageros in Sud-Carolina ha demonstrate que iste aves arriva plus securmante a lor destination si le direction de lor viage es sud-nord e non nord-sud.

► **Agronomia.**—Le numero de insectos que ha disveloppate racias resistente al insecticidas usate contra illos devencia alarmantemente grande. Le plus recente addition a iste lista es le brun ixode canin (*Rhipicephalus sanguineus*). Iste peste comencia redisseminar se in New Jersey in un forma non vulnerabile per chlordano per que illo habeva essite quasi integremente eradicate.

► **Physiologia.**—Nostre naso non ha le function de proteger nostre respiration sed de proteger nostre senso olfactori. Iste conclusion esseva formulate per Sir Victor Negus del Hospital Middlesex in Anglaterra post que ille habeva constatare que le dimensiones del membranas de humidification nasal varia in differente animales in un correlation directe con le acutesssa del senso olfactori.

► **Technologia.**—Le utilisation del energia solar es avantiate significativamente per un simple e incostoso convertitor de lumine in calor, disveloppate per H. Tabor del Laboratorio Physic de Israel. Le apparatura consiste simplemente de un platta de cupro coperte per un strato electroplegic de nickel, zinc, e sulfidos. Le cupro obtene assi un tenuissime copertura nigre que aborre 90 pro cento del spectro visible e transforma lo in calor. In contrasto con altere superficies nigre, le platta de Tabor ha le utilissime qualitate que illo eradia su calor multo lentemente.

► **Chirurgia.**—Trompetteros e siflatores de vitro suffre non infrequentemente de un "lesion professional" que se manifesta super toto in symptomas de marcate e persistente raucitate del voce e, in plus sever casos, de difficultate de inglutimento e attaccos de tusse. Le causa immediate de iste symptomas es un specie de hernia del larynge que apparentemente pote resultar de continue e prolongate effortios expiratori. Dr. B. J. Soboroff de Chicago, qui ha investigate iste phenomeno, considera le excision del hernia como le sol efficace therapia possibile. Illo reporta que le prime casos del syndrome unquam observee occurreva in muezzins mohammedan.

► **Aeronautica.**—Le statounitese Fortia Aerec experimenta con specialmente construite cassas de ligno pro le ejection, sin paracaduta, de merces ex aviones viagiante a alte velocitates. Le cassas tocca le terra a solmente 84 km per hora.

SCIENCE NEWS LETTER

VOL. 69 MARCH 31, 1956 NO. 13

The Weekly Summary of Current Science, published every Saturday by SCIENCE SERVICE, Inc., 1719 N St., N. W., Washington 6, D. C., NORTH 7-2255. Edited by WATSON DAVIS.

Subscription rates: 1 yr., \$5.50; 2 yrs., \$10.00; 3 yrs., \$14.50; single copy, 15 cents, more than six months old, 25 cents. No charge for foreign postage.

Change of address: Three weeks notice is required. When ordering a change please state exactly how magazine is now addressed. Your new address should include postal zone number if you have one.

Copyright, 1956, by Science Service, Inc. Republication of any portion of SCIENCE NEWS LETTER is strictly prohibited. Newspapers, magazines and other publications are invited to avail themselves of the numerous syndicated services issued by Science Service. Science Service also publishes CHEMISTRY (monthly) and THINGS of Science (monthly).

Printed in U. S. A. Entered as second class matter at the post office at Washington, D. C., under the act of March 3, 1879. Acceptance for mailing at the special rate of postage provided for by Sec. 34.40, P. L. and R., 1948 Edition, paragraph (d) (act of February 28, 1925; 39 U. S. Code 283) authorized February 28, 1950. Established in mimeographed form March 13, 1922. Title registered as trademark, U. S. and Canadian Patent Offices. Indexed in Reader's Guide to Periodical Literature, Abridged Guide, and the Engineering Index.

Member Audit Bureau of Circulation, Advertising Representatives: Howland and Howland, Inc., 1 E. 54th St., New York 22, Eldorado 5-5666, and 435 N. Michigan Ave., Chicago 11, Superior 7-6048.

SCIENCE SERVICE

The Institution for the Popularization of Science organized 1921 as a non-profit corporation.

Board of Trustees — Nominated by the American Association for the Advancement of Science: Kirtley F. Mather, Harvard University; Paul B. Sears, Yale University; Karl Lark-Horovitz, Purdue University. Nominated by the National Academy of Sciences: Edward U. Condon, Berkeley, Calif.; Harlow Shapley, Harvard College Observatory; George W. Corner, Carnegie Institution of Washington. Nominated by the National Research Council: Ross G. Harrison, Yale University; Leonard Carmichael, Smithsonian Institution; Jerome Hunsaker, Massachusetts Institute of Technology. Nominated by the Journalistic Profession: Neil H. Swanson, Ruxton, Md.; O. W. Riegel, Washington and Lee University; Michael A. Gorman, Flint Journal. Nominated by the Scripps Estate: Edward J. Meeman, Memphis Press-Scimitar; John T. O'Rourke, Washington Daily News; Charles E. Scripps, Cincinnati, Ohio.

Officers — President: Leonard Carmichael; Vice President and Chairman of Executive Committee: Charles E. Scripps; Treasurer: O. W. Riegel; Secretary: Watson Davis.

Staff — Director: Watson Davis. Writers: Jane Stafford, Marjorie Van de Water, Ann Ewing, Howard Simons, Dorothy Schriver, Helen M. Davis. Science Clubs of America: Joseph H. Kraus, Margaret E. Patterson. Photography: Fremont Davis. Production: Priscilla Howe, Marcia Nelson. Interlingua Division in New York: Alexander Gode, 80 E. 11th St., GRameroy 3-5410.
