

chemistry are projects planned for this cyclotron.

After a gigantic moving job during which the 80-ton machine was transferred to Los Angeles from the Berkeley campus, the cyclotron was completely overhauled and refurbished under the direction of two well-known young nuclear physicists who cut their scientific

teeth on this instrument and who accompanied it on the long haul from Berkeley. It is housed in a new \$75,000 temporary building constructed especially for this purpose on the Los Angeles campus.

In charge of the work is Dr. J. Reginald Richardson, associate professor of physics at U. C. L. A.

GENERAL SCIENCE

Questionnaire Censorship

► THE civilian Research and Development Board and the Departments of the Army and the Navy were accused of attempting "to prevent scientists from finding out just where they stand on security matters."

The charge was made in a report by the Committee on Secrecy and Clearance of the Federation of American Scientists in Washington. Members of the committee are all Cornell University scientists.

They sent a questionnaire to 140 laboratories last fall seeking information on loyalty clearance of scientists. Forty percent of the laboratories, including the atomic bomb laboratory at Los Alamos, N. Mex., answered the questions. But some officers of the Navy and the Army and an official of the Research and Development Board tried to obstruct the investigation, the committee declared in its report published in the *Bulletin of the Atomic Scientists* in Chicago.

A memorandum from F. H. Richardson, deputy executive secretary of the Research and Development Board headed by Dr. Vannevar Bush, to expert consultants of the Board was termed "intolerable" by the Federation committee.

The memorandum reprinted in the report does not mention the committee's questionnaire specifically. It calls attention to questionnaires concerning clearance procedures and requests that they be sent to the Board before they are answered.

A portion of the Board memorandum declares:

"There are in existence today a large number of organizations whose objective is to gather such information and later use it as material for propaganda and 'smear' programs in an attempt to discredit the U. S. form of government."

Commenting on the memorandum, the Federation of American Scientists report contended that "It operates wholly by innuendo, naming no names, citing no questions."

The Research and Development Board, the committee found, "has apparently at least some policy-making employees more military than the military."

Both Army and Navy officials were reported to have warned laboratories against answering the committee's questionnaire.

An inquiry by the committee to the office of Rear Adm. Thomas B. Inglis, Chief of Naval Intelligence, asked which of the questions on the questionnaire were classified.

"I regret to inform you that I am unable to supply you with the information requested," the report quotes Adm. Inglis as answering.

"We have told the story of the response to our questionnaire as a sign of 'the Prussian disease,'" the committee of scientists concluded.

The report explains that the term "Prussian disease", which has been used by Dr. Albert Einstein, includes "gradual encroachment upon the rights of scientists as citizens, and upon their freedom as scholars, the suppression of criticism, and the establishment of the official one-track mind . . ."

This report was the second made by the Federation's Committee on Secrecy and Clearance, which several weeks ago criticized loyalty clearance procedures. Members of the committee include a leading atomic scientist, Dr. Hans A. Bethe, and a Nobel prize winner, Dr. P. J. W. Debye, chairman of the department of chemistry at Cornell. Dr. S. H. Bauer is chairman of the group which includes Drs. L. M. Brown, G. K. Fraenkel, A. R. Moore, Philip Morrison, R. S. Rochlin and R. R. Wilson.

Science News Letter, June 19, 1948

Products made with lard, such as potato chips, pastries and crackers, are kept in good condition much longer by use of a new antioxidant; the same preparation also greatly increases the keeping time of lard itself.

ORNITHOLOGY

Gulls Shown as Robbers Of Other Birds' Nests

► GULLS as birds of prey, taking eggs from the nests of other birds and killing their young, as well as field mice, ground squirrels and other small mammals, make an unusual picture of these white-winged water-fowl presented in *The Condor* (May-June) by Dr. Arthur C. Twomey of the Carnegie Museum, Pittsburgh.

Presence of other birds' eggs in the nests of California gulls has puzzled other observers; but Dr. Twomey states that they are stolen and carried off for food. Sometimes the gulls carry them in

SCIENCE SERVICE

The Institution for the Popularization of Science organized 1921 as a non-profit corporation.

Board of Trustees—Nominated by the American Association for the Advancement of Science: Edwin G. Conklin, American Philosophical Society; Karl Lark-Horowitz, Purdue University. **Kirtley F. Mather, Harvard University.** **Nominated by the National Academy of Sciences:** Harlow Shapley, Harvard College Observatory; Warren H. Lewis, Wistar Institute; R. A. Millikan, California Institute of Technology. **Nominated by the National Research Council:** Hugh S. Taylor, Princeton University; Ross G. Harrison, Yale University; Alexander Wetmore, Secretary, Smithsonian Institution. **Nominated by the Journalistic Profession:** A. H. Kirchofer, Buffalo Evening News; Neil H. Swanson, Executive Editor, Sun Papers; O. W. Riegel, Washington and Lee School of Journalism. **Nominated by the E. W. Scripps Estate:** H. L. Smithton, Executive Agent of E. W. Scripps Trust; Frank R. Ford, Evansville Press; Charles E. Scripps, Scripps Howard Newspapers, Cleveland, Ohio.

Officers—President: Harlow Shapley, **Vice President and Chairman of Executive Committee:** Alexander Wetmore, **Treasurer:** O. W. Riegel. **Secretary:** Watson Davis.

Staff—Director: Watson Davis. **Writers:** Frank Thone, Jane Stafford, A. C. Monahan, Marjorie Van de Water, Martha G. Morrow, Ron Ross. **Science Clubs of America:** Joseph H. Kraus, Margaret E. Patterson. **Photography:** Fremont Davis. **Sales and Advertising:** Hallie Jenkins. **Production:** Priscilla Howe.

their beaks, but more often they swallow them whole and later regurgitate them. They may let them lie around in the nest for a while, but after their own young are hatched the alien eggs are broken open and eaten.

California gulls range far inland; Dr. Twomey has observed their habits in Idaho, where he saw them attack and kill the young of wild geese, carrying

them off to feed to their own nestlings. Gophers, ground squirrels and other small animals met the same fate.

Dr. Twomey cautions against regarding California gulls as "vermin" and subjecting them to persecution because of these predatory habits. They destroy immense numbers of destructive insects, he points out, and have long been known as voracious devourers of mice.

NUCLEAR PHYSICS

New Powerful Accelerator

Expected to be largest and most powerful laboratory research tool of its type in the world. Will take two years to complete and cost \$2,000,000.

► THE most powerful electrostatic accelerator known in the world will be constructed beside a cliff on a mesa in New Mexico at the Los Alamos Scientific Laboratory of the University of California, the U. S. Atomic Energy Commission has announced.

This new Van de Graaff-type generator will yield positive ions with energies up to 12,000,000 electron volts. The energy will be far less than the billion-electron-volt level proposed for new cyclotron-type "atom smashers," but the electrostatic generator has many advantages for certain types of atomic research.

Flexible, high precision energy control to one-tenth of one percent will be possible with the new machine. Scientists can change from one type of ion to another with continuously variable energies from 2,000,000 to 12,000,000 electron volts. Neutron beams between 30,000 and 30,000,000 electron volts will also be available.

Using the new accelerator, it will be possible to study the properties of both light and complex nuclei below 20,000,000 electron volts. Precise data are needed in this range which cannot be obtained

with other atom smashers.

The Van de Graaff generator is named for Dr. R. J. Van de Graaff of the Massachusetts Institute of Technology, the scientist who first used a belt to convey charge to high electrostatic potentials. The new machine planned for Los Alamos will be a pressurized Van de Graaff on which pioneering work was done by Prof. R. G. Herb of the University of Wisconsin.

The cliff-side structure will be 120 feet high with a control room and laboratory space housed on the top of the mesa. The generator will be 13.5 feet in diameter and 39 feet high. Total cost of the new generator and buildings will be \$2,000,000 and two years will be required for completion.

The electric charge is carried from the bottom to the top by a cotton belt 30 inches wide. By spraying the belt with a charge at the base, a great potential difference can be built up between the upper electrode and the ground. This potential difference is used to accelerate charged particles down two evacuated tubes in the column.

Science News Letter, June 19, 1948

ACCELERATOR MODEL—Important parts of the proposed 12,000,000 electron volt electrostatic accelerator are: (a) heavy crane (b) pressure shell enclosing generator (c) inner insulating column enclosing accelerating tubes (d) 90 degree reflecting magnet and (e) target rooms.

of his discovery being forwarded by Dr. L. Volta, director of the Royal University Observatory, Turin, Italy. Astronomers in this country were notified of the comet's discovery and position by Harvard Observatory, clearing house for such information in the western hemisphere.

Prof. J. J. Nassau, director of the Warner and Swasey Observatory, the Case Institute of Technology, at East Cleveland, took the picture on the cover of this week's SCIENCE NEWS LETTER with the 24-36 inch Schmidt-type telescope-camera at the observatory on June 6 at 4:15 a.m., EDT. Exposure time was four minutes. It shows the comet's tail extending for 2.5 degrees across the heavens. The comet was moving rapidly northwest.

Star-lovers watched the comet as it moved across the heavens, going from the constellation of Perseus into the constellation of Andromeda and on into Perseus again. At first visible just before dawn, as it moved away from the sun the comet could be seen in the early morning hours.

Comet Honda-Bernasconi soon began to fade in brightness, having dropped to fifth magnitude within a week of its discovery.

Science News Letter, June 19, 1948

ASTRONOMY

Spot Bright New Comet

See Front Cover

► A BRIGHT new comet flashed across the heavens early this month. Of the fourth magnitude when first seen, it was easily picked up with binoculars, and could also be spotted with the naked eye by people far from city lights.

The comet was discovered by watchful

observers both in Japan and Italy. Minoru Honda of Japan's Kurashiki Observatory spotted it on June 2. This is the second comet Mr. Honda has discovered within one year, as he spotted a ninth magnitude one last November.

The comet was independently found on June 4 by Giovanni Bernasconi, word
